Section 1: My Idea

Program Name: Back2Work

By: Byron Ross jr

Problem: It is often hard for the unemployed to find and receive jobs

Solution: Solving unemployment, creating an app that shows nearby jobs that are in desperate need of help

Features:

- Sign up for the app, the requirements would be something like having some kind of physical ID such as a school id, birth certificate, State id, And or driver's license.
- For example: Thaddeus Stevens school id is proof that I am Byron Ross going to Thaddeus Stevens college. If you are under the age of 18 you will have to provide pictures of your work permit and school id/state id. You have to be 16 years old to sign up.
- This app will have a 2-step verification process, so your account and information are secure. For example: You create a password and type it 2 times to make sure that the password you created is remembered by the user. The two-step verification comes in where you can type your email, phone number, or create a question that only you know, such as your favorite school subject.
- Jobs that are in need of help put in requests for it.

Reason why this was not chosen:

This solves an issue that already has a solution in previous applications/ websites. The lack of markets will make it difficult to find and create uniqueness and advantages in the job-finding service market. The features currently present are about the sign in feature more than the actions the app is taking to help the customer. - JV

Chosen Idea

Program name: City Events App (CityLink)

By: Jared Scheurer

Problem – No central forum board to view and browse events planned in or around the city.

Solution – App that serves as a new-age town square bulletin board to create and sign-up for events

Features –

- Creation of events (date, time, name of event, company/group/individual behind the event, type of event, short description of event)
- Creation of accounts (3 types: Company, Groups, or Individuals) – Hidden Master ADMIN account for dev team
- Individuals can follow other individuals, companies; or join groups; or create preferred partners for specified events
- A search tool that can sort events by any of the previous parameters (including how many are attending); base display in chronological (by most recently listed events)
- A fun “near you soon/today” option that you can choose that displays events (with minor filtering allowed)
- Phone App / Web Page compatibility
- Ability to blacklist/ban individuals from certain companies, groups, or the app as a whole; Users can “flag” others so that they’re notified if they will be attending an event with someone they personally don’t like
- Potential fun point system/leaderboard for community service event participation

Pros –

- Easily accessible to anyone with a phone and connection
- Easy to use tool for community building

Reason why this was chosen:

- Easily realistic of an idea to implement into the real world and to create a high amount of quality
- Topic that relates a lot with community and is a socially beneficial project to create
- This can be scaled to states and much more

This provides a service to organizations and companies that are not seen already, and the market for this type of service can be seen. This not only helps groups of people, but it also helps the environment and the community as a whole.

Section 2: Rejected Ideas

Program Name: Gambling App Idea

By: Kaden Grisafi

- Integrate Personal Banking and Gambling.
- Customers get a 5% direct deposit bonus that goes to the week's bet.
- Debit/credit card purchases for the week are rounded to the nearest dollar then added up for the weekly bet
- Having deposited \$1000 that stays in the account for 90 days earns a \$100 in gambling credit.
- Host paid fantasy sport leagues like football, baseball, basketball hockey.
- Offer prediction markets to promote regular daily gambling
- Live betting on absolutely anything that could be considered a sport
- Have mini games where users can earn/lose money
- New accounts get 1 crypto coin could be \$.000001 in value up to 1 bitcoin for a lucky user.
- Customers able to take small to large loans with their car/ house as collateralLoans could be in the form of a crypto currency where the amount owed is the initial value of the coin plus interest.
- Have physical bank locations, where there are slot machines, a pawn shop, crypto atm, and a small desk for regular banking
- Free hotel rooms for premium members (some kind of annual fee) at banking locations
- Credit card with gambling point rewards
- Customers can watch ads to gain gambling credit
- Customers who gamble a certain amount or watch a certain number of ads are eligible for free trips, concerts, or sport games
- Customers can invite friends to get .5% of their loses in the form of gambling credit, and customers that join with a friend link get an extra crypto coin
- Have special events with boosted profits, or credit for placing bets regularly
- Direct discounted uber and food delivery integration in app, to promote regular use

- Only can download app from a friend link
- CDs with payouts in the form of gambling credit at a higher rate, or real money given at a lower rate

Pros:

Incredibly profitable, Ad free platform (unless you need more credit)

Reason why this was not chosen:

This idea does not have a benefit on society. The idea is very morally questionable and preys on its customers with gambling addictions. There would seem to be very high startup costs, because a bank would need to be made, even if it is initially just online. Could make the middle class completely disappear if the app is successful (very bad thing). Possible generational poverty. Many competitors are in the gambling space already. Unclear why someone would want to have their banking and gambling combined.

Program Name: S.O.S. App

By: Ellie Vance

A real-time campus safety app that connects nearby verified students during emergencies before authorities arrive.

With one tap, users send an SOS alert sharing live location to Friends, nearby helpers, or even campus security

Features include:

- trusted circles
- live tracking
- anonymous reporting
- an auto-follow mode for walking alone

Reason why this was not chosen:

The idea is a more specific concept compared to already made software apps and websites (Life 360, Glympse). Although this could be beneficial to individuals, the situations this idea is designed for are too specific the market is already populated. There can be cases where this software can be used to do more harm than good (i.e. a threat gets a hold of someone's device). - JV

Program Name: ShareABite/ReMeal

By: Kay'ron Brown

Problem: There are a lot of people in need, and it is often difficult to help.

Solution: The main point of my app is to make it easier for people to donate not only leftover meals but also food items to local shelters that help people in need.

Features:

- The app will show how many people are staying at each shelter, so donors can know exactly how much food or how many meals to prepare.
- This makes giving more organized and helps make sure no food is wasted. It also encourages people to think about others and take action to help their community.
- Include updates about shelters, donation goals, and ways to volunteer.
- All the money the app earns will go toward fundraisers and programs that support shelters, families, and people facing hunger.

Overall, the app's goal is to reduce food waste, fight hunger, and bring communities together through kindness and giving.

Reason why this was not chosen:

This project will need a lot of manpower or a powerful AI system that can detect, manage and act like an algorithm. I can't see this burring older fundraisers as new ones coming out creating competition and the risk of people just never seeing a fundraiser they may be interested in. There is a big risk of random people making donation requests making it harder to spot people/ organizations in need. - JV

Program Name: Stop Sign Camera

By: Juan Vasquez-Mesa

Problem: People often run red lights, causing a risk for pedestrians and other vehicles on the road.

Solution: The camera will be placed at stop signs and it checks how long a car has been stopped for with some padding if the car starts early by accident, if they do not stop at all the camera on the other side of the stop sign will take an image of the license plate and send a virtual ticket to the car owner.

Features:

- A camera that can take a screenshot/ picture after a condition is checked
- Motion scanner
- Database with information on drivers that can ticket people
- Night Vision Camera

Pros:

- Higher ability to enforce safety in cities and communities
- Allows police officers to not have to worry about people rolling stop signs
- Could double to check if people are speeding
- Allow more cameras in cities in case some kind of danger occurs

Reason why this was not chosen:

- There will be too much push-back from the community
- Cost of installation
- Communities will have to push back against this idea or find ways to bypass the checks
- Power consumption
 - JV

Program Name: Attendance Reminder

By: Owen Sayenga

Problem: Students forgetting class times or teachers forgetting to take attendance consistently

Solution: A mobile app that tracks the time and location of the user's classes. On the teacher's side, it can take attendance.

Features:

- Tracks all classes, displaying time and location for classes of the current day
- Displays a series of notifications set to as many for whatever time the user desires to notify the user before class

- Displays how many late/absences the user has
- On the teacher's side, reminders before class and during class to take attendance
- Teachers can cancel classes or post due dates
- The app can be used to sign in to class when within the location to help with attendance
- Teachers can see who has signed in and when

Pros:

- Help students keep better awareness of their classes
- Help teachers keep attendance higher

Reason why this was not chosen:

- Those with good memorization/time management will not need the app.
- Teachers who do not update their end will negatively impact students who use the app.
- The scope is relatively small and could be much larger than what it is.
- Students will either decide not to use this app or will keep struggling with this idea.
- Teachers already have a method to check attendance and will most likely not use this.

Program Name: Personal Library

By: Israel Acosta

Problem: I am an avid reader, but I must use 4-5 apps to categorize my books, leave reviews and talk to others about the books that I liked and disliked.

Solution: Combine the things that I like into one app.

Features:

- Create an account
- Phone App to catalog books that the user owns
- Allow users to add books to the database
- A reading tracker that will also allow the user to help build a reading habit
- Track books that you want to read (think like a wish list)
- Allow the user to review books that the user has read
- Recommend books based on other users with similar reviews
- Allows the user to add friends to see their books/reviews
- Allow users to form groups to talk about books

Reason why this was not chosen:

Competition is steep with the number of other popular apps in existence and services that provide other reading services. It was also not popular with the group, not many readers.

Section 3: Program Requirements

Functional Requirements:

- Ability to gather events in a city/zip code/distance away
- Ability to create an account (3 types: Company, Groups, Individuals)
- Ability to sign up to an event
- Displaying event -initial outreach to event creators to post events on web page
- event additions should be seen immediately when the user refreshes the page

Non-functional Requirements:

- Ability to follow
- Ability to People are awarded points based on if they participate in an event
- Ability to arrange events by date
- Sponsored event page
- Possible future affiliate link profit
- Personalized event feed based on category interest, previous event ratings, and friends/ followed event coordinators
- QR code scanner option to show attendance at events when arriving to the event

- Review sections (2 types: Normal and Verified QR)
- General contact between the event host and attendees
- general contact section (host announcements / 1 on 1 messages)
- sorting feature for events based on the 'Search' UI requirement
- Feature to show similar interest/ events that you and another person/group have both participated in
- friend/group messaging
- if an event has already occurred it can be archived
- scoreboard
- features to make events clarify if they are 18+, 13+, etc.
- Free first event, pay in-between 6 weeks
- A map feature that will show the meet up spot for the event (people who are helping set up and work for the event)
- Ability to save tags previously searched for or having them reset each time you search for events

UI (User Interface) Requirements:

- Function through phone app and website counterpart
- 'Recommended-for-you' page based off prior events visited or
- 'Near you' page
- 'Featured' section for each page for sponsored events
- 'Search' page to look up events
- 'Friend Feed' page that displays friend's events or recommendations
- 'Friend Profile' displays prior events visited, likes/dislikes to events, and upcoming events
- 'Tag' for nonprofits accounts/events
- 'Tags' for +18, Kids, Family, Alcohol, Live-music, Free, Paid (Lists cost)
- Settings tab (themes, Profile, Data management, other accessibility settings (Text to speech, contrast colors))

Data Requirements:

- Database for accounts/events
- Ask users for their location

Assumptions

- Internet connection and online access
- Using the software can keep track of the current time and date for events

Questions for Follow-Up:

- Desktop functionality
- Potential partners (Uber)
- Find established events and request them onto the website/app
- How will we monitor the posted events?

Team Roles and Responsibilities:

- Client: Jared Scheurer: Product Owner, Stakeholder
- Client: Ellie Vance: Stakeholder
- Client: Kayron Brown: Stakeholder
- Client: Byron Ross jr: Stakeholder
- Developer: Kaden Grisafi: Communicator, Note taker
- Developer: Juan Vasquez-Mesa: Presenter, Note taker
- Developer: Israel Acosta: Documenter
- Developer: Owen Sayenga: Communicator, Note taker

Section 5: Project Summary

CityLink is an app/website that aims to connect people to events in their area. The software uses the customer's location and interests to match the customer to events. Events have labels for details, like recommended/ minimum age to participate. Additionally, the software indicates if alcohol will be served and the entry cost. Customers can friend other users to view events friends are attending/attended. Friends can make friend groups, with each group providing additional recommendations based on each member. Also, with the ability to ban or blacklist individuals from using the app (if they were behaving inappropriately). The software will support event ratings, using a QR code posted past the entry in each event to verify the attendance of the user. Unlimited events can be posted using a premium account with the cost of the account being \$12 a year. All customers can post 1 event for free without needing a premium account. The app will have 2 main modes with the first being near upcoming events in the user's area, which takes a broader approach and follows the user's interests loosely. The other mode will allow the user to select a city/zip code, a distance, event categories, and date ranges. This allows the customer to find and plan larger events like conventions and music festivals. Looking forward to the future avenues for potential partnerships with already existing companies (Uber, Convention Centers, and Travel agencies, etc).
